A secure LSP connection

GPs, pharmacies and specialists share their notes and medical data through the National Exchange Point (LSP). We can link healthcare organisations to it with Enovation IspConnect. This application fulfils all security requirements imposed on LSP systems by the Association of Healthcare Providers for Healthcare Communication (VZVZ). It also features extensive log-in security, a secure GZN connection and an extensive authorisation matrix to prevent unauthorised use and data breaches.

Nationwide access for GPs, pharmacists and medical centres

An LSP system is used to exchange medical data between prescribing doctors and pharmacists that monitor and dispense the medication. GPs also use the LSP to check the current status of patient files during evening and night shifts.

Nationwide and regional

Patient medical data stored in the LSP can be accessed nationwide. Patients' GP records are only available from the GP services in their own region. LSP data is requested from the source file of the relevant healthcare provider(s) through an index. This is known as a 'pull' healthcare system and the patient must consent in advance.

Avoid data leaks

The LSP has up-to-date security measures to prevent unauthorised use and data breaches as much as possible. The VZVZ is responsible for the electronic exchange of medical data through the LSP on a national level. The organisation manages, maintains and develops the national digital healthcare infrastructure.
