The patient portal always at your fingertips

Accompanying patients before, during and after treatment is an intense process. It costs both the patient and the healthcare professional a lot of time and effort. Personal contact is invaluable here. But it is just as important that patients can go through all the information at their own leisure. That way they are better prepared for what is to come. This is where the Mobile App for Patients comes in. It is a mobile patient portal accessible on a smartphone or tablet where patients can find all important information for their entire healthcare pathway.

All
information
in the app

Extra support and involvement in the healthcare process

Healthcare providers bring together all the information relevant to the patient in the Mobile App for Patients. Patients can find their personal medical file with all the information about their condition or treatment, preparations ahead of treatment and their progress. They can also find information about medication and any side effects. In the online calendar, they can view their appointments, change and/or cancel them and find their way around the healthcare facility.

Easy and personal contact

Patients can also ask questions and share their concerns through the Mobile App for Patients. The integrated chat function enables them to send a direct message to their doctor or specialist, who can then respond at a time that works for them. The patient and healthcare professional can also make video calls through the application where necessary.

Less contact, more freedom

Users are kept actively informed by the Mobile App for Patients and can do more for themselves. This reduces the need for hospital visits. The burden on patients is alleviated and they enjoy more freedom and independence throughout their care pathway while doctors have more time for other duties.
