Efficient and error-free rostering

Planning shifts in hospitals is a complex process, prone to error. Changes to rotas take time and it's often difficult to maintain a clear overview, hindering collaboration within departments and ultimately affecting patient care. This results in a need for a digital solution that automates rostering, prevents conflicts and provides real-time insight into availability and capacity planning – allowing care professionals to focus on what really matters: delivering quality care.

Smart rostering solution

Rostering is an innovative web-based application that automates and simplifies shift planning for medical specialists, junior doctors and support staff. With real-time insight, automatic planners and an intuitive interface, it saves up to 60% of planning time. Rostering is suitable for both small departments and large multi-site hospitals.

Central overview of shifts

Allshifts automatically brings all duties together in one central overview, so shift changes are immediately visible and processed accurately. Real World Monitoring is also highly versatile, and departments not yet using rostering can also participate using the Light version.

Automatic planners

Automatic planners allocate shifts based on capacity, collective labour agreements and absences, supporting both daytime schedules and 24-hour rotas for emergency and intensive care units. They flag potential bottlenecks but remain manually adjustable, constantly ensuring flexibility.

Rostering in the healthcare process

Up to 60% time savings

Real-time insight into rotas

Automatic shift allocation

User-friendly interface

Suitable for any hospital
